

Dealing with randomisation bias in a social experiment: The case of ERA

WPEG 2012

Barbara Sianesi

The Employment Retention and Advancement (ERA) programme

ERA treatment

Offer of a package of time-limited (2 years) support once in work

Eligibles

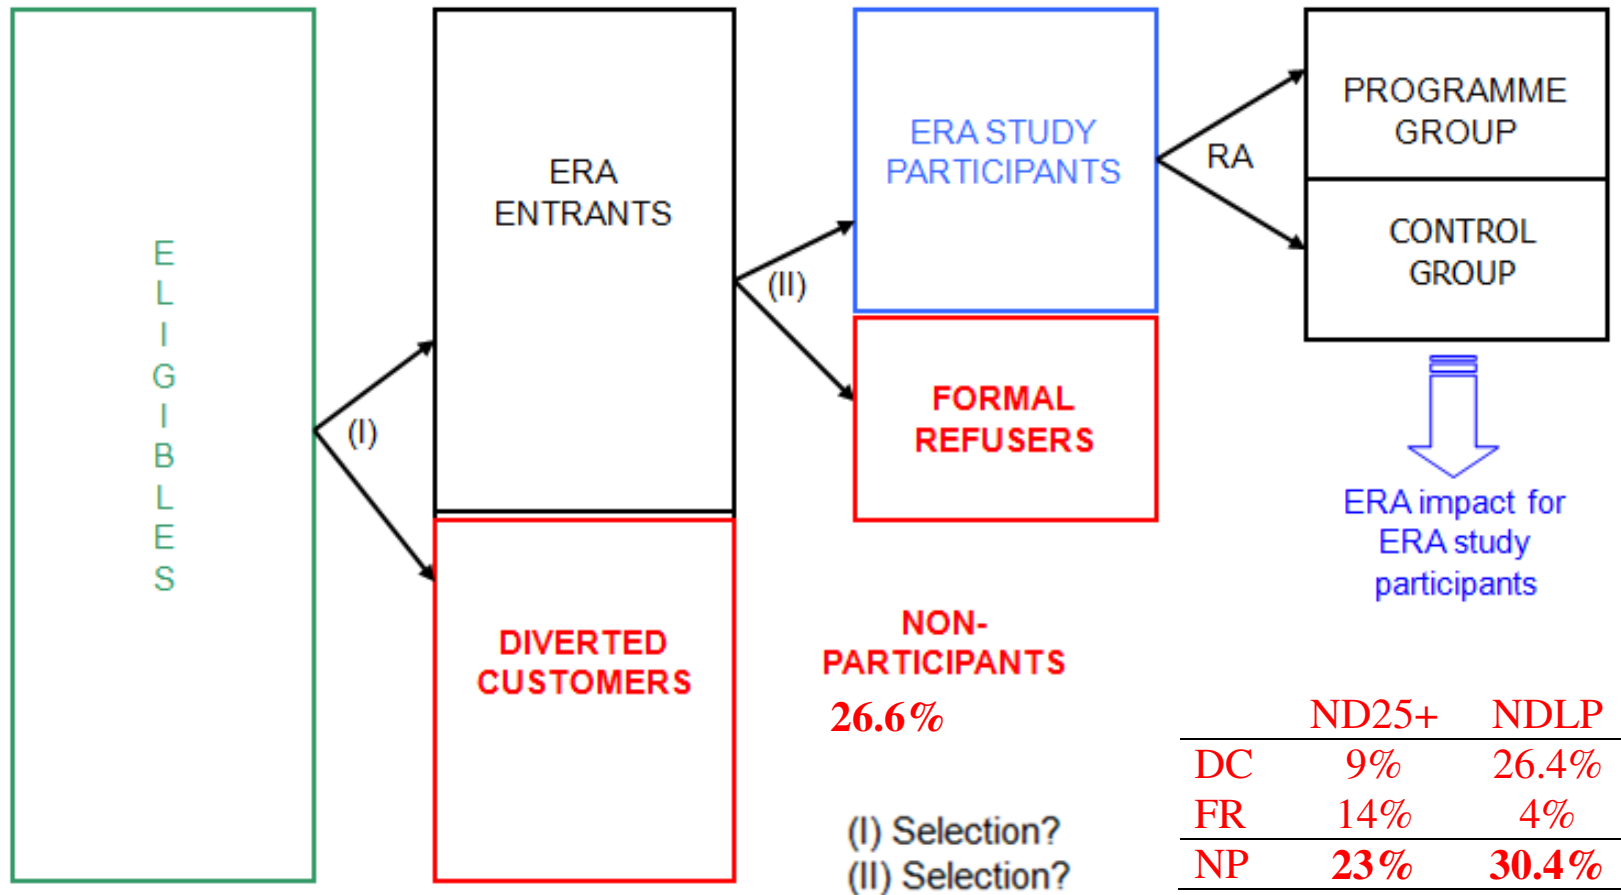

- 1) LT unemployed mandated for ND25+
- 2) Unemployed volunteering for NDLP
- 3) [LPs on WTC working PT who volunteer for ERA]

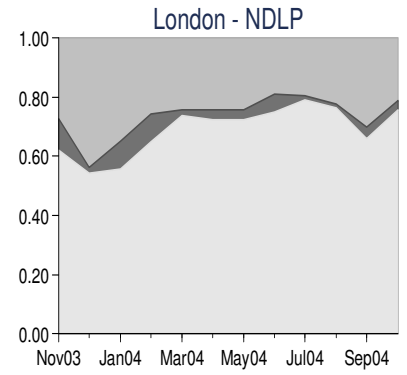

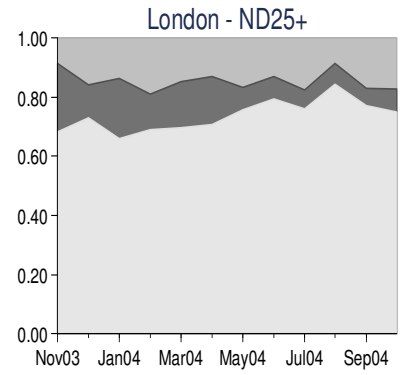

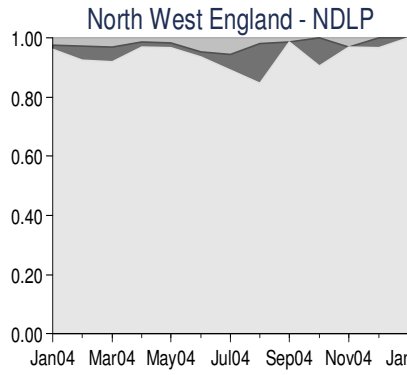

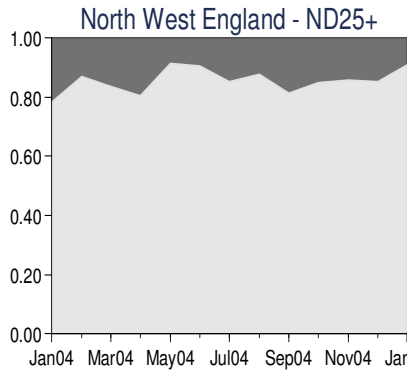

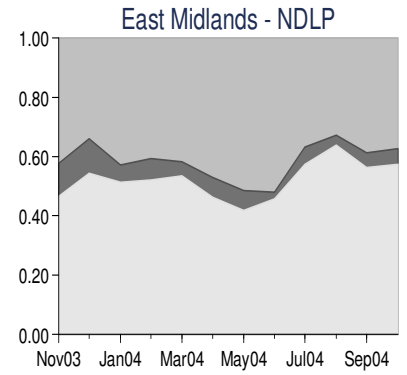

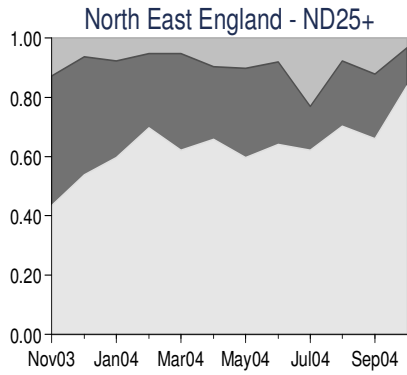

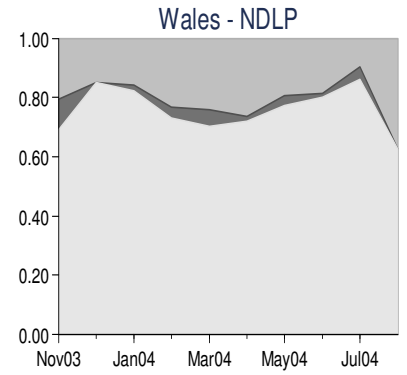

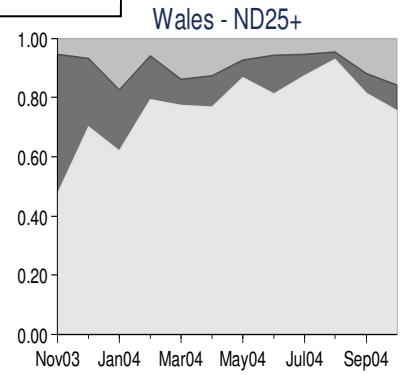

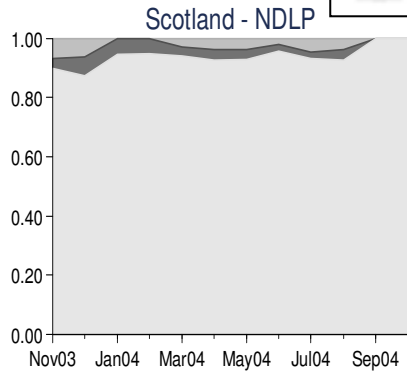

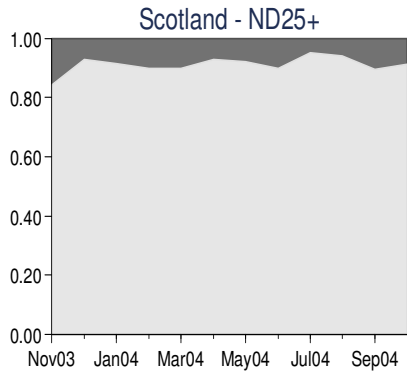

Tested

Large-scale ($N=16,000$), multi-site (6 districts) RA social experiment

Intake: Oct 2003 – Apr 2005 (pilots end Oct 2007)

Non-participation in the ERA study

Issues raised by non-participation

- Policymaker interested in impact of offering ERA for all those eligible to receive the offer.
 - Think of ERA as an integral component of the New Deal
- But... ERA tested only on a subset of the eligibles, those who
 1. reached the randomisation stage and
 2. agreed to participate in the study

Two ways to view non-participation

- **Impact of offering ERA eligibility on the *eligibles* (in the 6 districts)**
 - Assess the scope for **randomisation bias** (Heckman, 1992 and Heckman *et al.*, 1999) introduced by non-participation in the experimental estimate for the parameter of interest
- **Impact of offering ERA eligibility on the *study participants* (in the 6 districts)**
 - Has non-participation affected the extent of **external validity** of the experimental results, and hence their representativeness and policy relevance?
 - How selective/policy-relevant is this subgroup?

ERA study offers rare chance to look at this issue!

- offer (ITT)
- ATE
- admin data

Research questions

- Impact on all eligibles
 - Impact on the non-participants
- Impact on all eligibles *versus* experimental impact on the participants
- Take up of ERA services by the non-participants

Methodology

Impact estimates under **selection-on-observables** → matching and re-weighting techniques

When follow-up data for non-participants not available: issue of survey and/or item non-response

Sample and data

	ND25		NDLP			
Eligibles	7,796	100.0%		7,261	100.0%	
– Study non-participants	1,790	23.0%		2,209	30.4%	
– Study participants	6,006	77.0%	100.0%	5,052	69.6%	100.0%
– with survey outcome	1,840		30.6%	1,745		34.5%
– without survey outcome	4,166		69.4%	3,307		65.5%

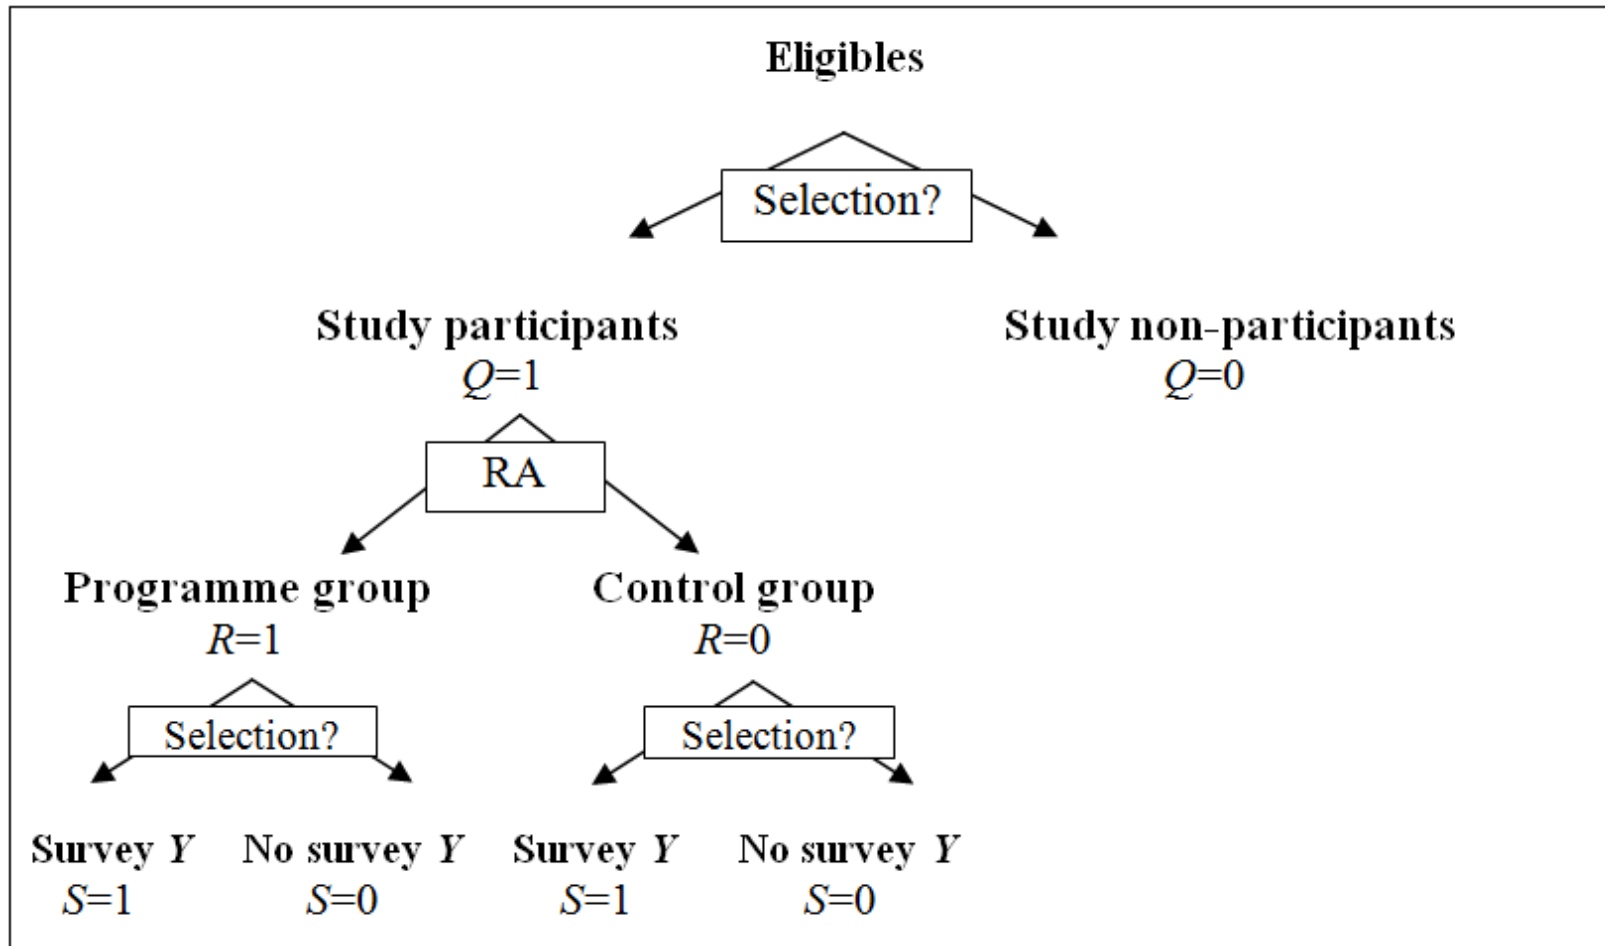

Outcomes

- 12-month follow-up
- employment (ever employed and days) – admin data
- benefits (days) – admin data
- annual earnings – survey data

Control variables

ERA district	
Inflow month	District-specific month from random assignment start when the individual started the ND25 Gateway or volunteered for NDLP
Demographics	Gender, age, ethnic minority, disability, partner (ND25+), number of children (NDLP), age of youngest child (NDLP)
Current spell	Not on benefits at inflow (NDLP), employed at inflow (indicator of very recent/current employment), time to show up (defined as the time between becoming mandatory for ND25+ and starting the Gateway or between being told about NDLP and volunteering for it), early entrant into ND25+ programme (Spent <540 days on JSA before entering ND25+)
Labour market history (3 years pre-inflow)	Past participation in basic skills, past participation in voluntary programmes (number of previous spells on: NDLP, New Deal for Musicians, New Deal Innovation Fund, New Deal Disabled People, WBLA or Outreach), past participation in ND25+, active benefit history dummies (JSA and compensation from NDYP, ND25+, Employment Zones and WBLA and Basic Skills), inactive benefit history dummies (Income Support and Incapacity Benefits); employment history dummies
Local conditions	Total New Deal caseload at office, share of lone parents in New Deal caseload at office, quintiles of the index of multiple deprivation, local unemployment rate

Methodology – Set-up

$ATE \equiv E(Y_1 - Y_0)$ average effect on *all* eligibles
 $ATE_1 \equiv E(Y_1 - Y_0 \mid Q=1)$ average effect on study participants
 $ATE_0 \equiv E(Y_1 - Y_0 \mid Q=0)$ average effect on non-participants

$$ATE = (1-p) \cdot ATE_1 + p \cdot ATE_0$$

If $Y_{1i} - Y_{0i} = \beta$ for all eligible i or $Q \perp (Y_1 - Y_0)$
 then $ATE_1 = ATE_0 = ATE$

Admin data: $ATE = (1-p) \cdot \{E(Y \mid R=1) - E(Y \mid R=0)\} + p \cdot \{E(Y_1 \mid Q=0) - E(Y \mid Q=0)\}$

Survey data: $ATE = (1-p) \cdot ATE_1 + p \cdot E(Y_1 - Y_0 \mid Q=0)$

Point estimate under selection-on-observables with follow-up data

$$ATE = (1-p) \cdot \{E(Y | R=1) - E(Y | R=0)\} + p \cdot \{E(Y_1 | Q=0) - E(Y | Q=0)\}$$

Akin to getting the **ATNT** using matching methods

Assume

$$(CIA-1) \quad E(Y_1 | Q=0, X) = E(Y_1 | Q=1, X)$$

$$(CS) \quad P(Q=1 | X) > 0 \quad \text{for all } X \text{ in the support of the eligibles}$$

$$\begin{aligned} E(Y_1 | Q=0) &= E_X[E(Y_1 | Q=0, X) | Q=0] = (CIA-1) = E_X[E(Y_1 | Q=1, X) | Q=0] \\ &= (RA) = E_X[E(Y_1 | R=1, X) | Q=0] = E_X[E(Y | R=1, X) | Q=0] \end{aligned}$$

Implementation

Match to each non-participant one or more similar programme group member(s) based on $p(x) \equiv P(Q=0 | X) = P(Q=0 | Q=0 \vee Q=1, X)$ or $P(Q=0 | Q=0 \vee R=1, X)$.

Sensitivity analysis

$$(CIA-1') \quad E(Y_1 | Q=0, X) = \theta E(Y_1 | Q=1, X)$$

allow participants and non-participants with the same X to differ in terms of some unobservable, which translates into a proportional difference of θ

Point estimate under selection-on-observables w/out follow-up data

$$ATE = (1-p) \cdot ATE_1 + p \cdot E(Y_1 - Y_0 | Q=0)$$

Akin to **attrition**

→ reweigh Y of the participants on the basis of the X of the eligibles to make them representative – in terms of X – of the full eligible population

Assume

$$(CIA-2) \quad E(Y_1 - Y_0 | Q=1, X) = E(Y_1 - Y_0 | Q=0, X) \quad \text{hence} = E(Y_1 - Y_0 | X)$$

$$\begin{aligned} ATE &\equiv E(Y_1 - Y_0) = E_X[E(Y_1 - Y_0 | X)] = (CIA-2) = E_X[E(Y_1 - Y_0 | Q=1, X)] \\ &= (RA) = E_X[E(Y_1 | R=1, X)] - E_X[E(Y_0 | R=0, X)] = E_X[E(Y | R=1, X)] - E_X[E(Y | R=0, X)] \end{aligned}$$

Implementation

The empirical counterpart can be derived in several ways:

1) Reweighting

Directly weigh the outcomes of the (responding) participants so as to reflect the distribution of X in the eligible population.

Ignoring survey and item non-response

$$A\hat{T}E = \left[\frac{(1-p)p_R}{\#(R=1)} \sum_{i \in \{R=1\}} \frac{y_i}{(1-p(x_i))p_R(x_i)} \right] - \left[\frac{(1-p)(1-p_R)}{\#(R=0)} \sum_{i \in \{R=0\}} \frac{y_i}{(1-p(x_i))(1-p_R(x_i))} \right]$$

where $p_R \equiv P(R=1 \mid Q=1)$ and $p_R(x) \equiv P(R=1 \mid Q=1, x)$

Allowing for survey and item non-response (selective non-response based on X)

$$A\hat{T}E = \left[\frac{1}{\#(R=1, S=1)} \sum_{i \in \{R=1, S=1\}} \frac{(1-p)p_{RS1}}{(1-p(x_i))p_{RS1}(x_i)} y_i \right] - \left[\frac{1}{\#(R=0, S=1)} \sum_{i \in \{R=0, S=1\}} \frac{(1-p)p_{RS0}}{(1-p(x_i))p_{RS0}(x_i)} y_i \right]$$

where $p_{RS1} \equiv P(R=1, S=1 \mid Q=1)$, $p_{RS0} \equiv P(R=0, S=1 \mid Q=1)$ and $p_{RS1}(x)$ and $p_{RS0}(x)$ are the corresponding probabilities conditional on x

2) Matching

Construct weights to realign X via matching

- exact specifications of pscore and response probabilities not needed
- can assess actual comparability

Can do it in 2 ways:

- A) separately recover ATE_0 and then combine it with experimental ATE_1 to get the ATE or
- B) recover ATE directly

Again, can do A) and B) both ignoring and allowing for survey and item non-response
(Detailed matching protocols in paper's Appendix)

Analysis of take-up

1. Are the non-participants individuals who even if offered ERA services would not take them up?
2. What kind of involvement would non-participants have had with JCP had they participated in the study and been assigned to the control group?

Assume CIA: Conditioning on X , participants and non-participants would have taken up the same amount of ERA services on average

Implementation: View take-up/involvement measures as outcomes and assess them as done for the admin outcomes (these are survey measures but non-response to these questions was <1%).

Found advice from JCP staff overall not at all helpful	5.8	5.2	4.1	3.7

Conclusions

- NDLP: story unchanged → 1st-year impact results *generalize* to full eligible population
 - no effect on employment and benefit outcomes
 - significant and substantial increased earnings
- ND25+: evidence of some randomization bias (or some loss in external validity)
 - experimental employment (and possibly earnings) impact estimates *underestimate* impact on all ND25+ entrants
 - RA designed to provide with accuracy “true” answer: effect for eligibles which is 30 or 50% larger than experimental estimate or a significant impact for the eligible population that surfaces when none was found experimentally can be viewed as a finding of substance
- “Under normal operation, non-participants would not be interested in taking up ERA support and incentives.”
 - No support for either intake group.
 - Non-participants display observed characteristics that make them quite likely to be involved with ERA and JCP more generally.
