THE LONDON SCHOOL OF ECONOMICS AND POLITICAL SCIENCE

 In many research contexts we might be interested in the extent to which the effect of some exposure X on some outcome Y is mediated by an intermediate variable M.

- In many research contexts we might be interested in the extent to which the effect of some exposure X on some outcome Y is mediated by an intermediate variable M.
- In other words we are interested in the study of mediation.

For example, how much of the effect of maternal smoking on infant mortality is due to its effect on birth weight?

De Stavola & Daniel/Mediation

- Estimation via ordinary least squares.
- Various options (delta method, bootstrapping) to obtain SE for the indirect effect.

$$E(Y|C,X,M) = \alpha_0 + \alpha_1 X + \alpha_2 M + \alpha_3^T C$$

$$E(Y|C,X) = \beta_0 + \beta_1 X + \beta_2^T C$$

- $\alpha_1$  is interpreted as the direct effect (not via *M*),
- $\beta_1$  is interpreted as the total effect,
- and thus  $\beta_1 \alpha_1$  is the indirect effect (via *M*).

#### Traditional approach SEMs Problems Novel approaches Summary References A linear Structural Equation Model Wright, 1921

Alternatively, consider a (linear) structural equations model:

$$E(Y|C, X, M) = \alpha_0 + \alpha_1 X + \alpha_2 M + \alpha_3^T C$$
$$E(M|C, X) = \gamma_0 + \gamma_1 X + \gamma_2^T C$$

De Stavola & Daniel/Mediation

$$E(Y|C, X, M) = \alpha_0 + \alpha_1 X + \alpha_2 M + \alpha_3^T C$$
$$E(M|C, X) = \gamma_0 + \gamma_1 X + \gamma_2^T C$$

De Stavola & Daniel/Mediation

$$E(Y|C, X, M) = \alpha_0 + \alpha_1 X + \alpha_2 M + \alpha_3^T C$$
$$E(M|C, X) = \gamma_0 + \gamma_1 X + \gamma_2^T C$$

•  $\alpha_1$  is (as before) the direct effect,

De Stavola & Daniel/Mediation

![](_page_31_Picture_1.jpeg)

![](_page_31_Figure_2.jpeg)

• Such *L* are problematic.

De Stavola & Daniel/Mediation

![](_page_32_Picture_1.jpeg)

![](_page_32_Figure_2.jpeg)

- Such *L* are problematic.
- Let us ignore *C* for simplicity, and, let us even ignore the arrow from *X* to *L* at first, ie *L* is NOT an intermediate confounder in this diagram for now...

(日)

![](_page_33_Picture_1.jpeg)

![](_page_33_Figure_2.jpeg)

• *L* is a confounder for the *M*-*Y* relation and therefore cannot be ignored.

・ロト ・ 母 ト ・ ヨ ト ・ ヨ ト … ヨ

![](_page_34_Picture_1.jpeg)

![](_page_34_Figure_2.jpeg)

- *L* is a confounder for the *M*-*Y* relation and therefore cannot be ignored.
- However conditioning on *M* (in the model for *Y*) induces an association between *X* and *L* even if there was none there before (and would alter an existing association).

< 日 > < 同 > < 回 > < 回 > < □ > <

![](_page_35_Picture_1.jpeg)

![](_page_35_Figure_2.jpeg)

- *L* is a confounder for the *M*-*Y* relation and therefore cannot be ignored.
- However conditioning on *M* (in the model for *Y*) induces an association between *X* and *L* even if there was none there before (and would alter an existing association).
- Hence we should also condition on L ...

• But this is NOT a solution when *L* is affected by *X*.

De Stavola & Daniel/Mediation

▲ロト ▲御 ト ▲注 ト ▲注 ト 一注

- But this is NOT a solution when *L* is affected by *X*.
- Since we block part of the direct effect (unmediated by *M*).

・ロト ・ 母 ト ・ ヨ ト ・ ヨ ト

- But this is NOT a solution when *L* is affected by *X*.
- Since we block part of the direct effect (unmediated by *M*).
- Thus standard regression cannot be used when there is intermediate confounding.

- But this is NOT a solution when *L* is affected by *X*.
- Since we block part of the direct effect (unmediated by *M*).
- Thus standard regression cannot be used when there is intermediate confounding.
- (SEMs could deal with this, but only for linear models for L, M and Y ...).

- 1. Lack of generality: Definitions are specific to simple linear models (in particular no *X-M* interactions).
- Identifiability: often not appreciated that unaccounted confounders V of the M-Y relationship:

would bias the partitioning of direct/indirect effects.

3. Intermediate confounding.

- 1. Lack of generality: Definitions are specific to simple linear models (in particular no *X-M* interactions).
- 2. Identifiability: often not appreciated that unaccounted confounders V of the M-Y relationship:

More recent contributions from the causal inference literature have brought clarity to these issues, and greater flexibility to the modelling.

 Let Y (x) be the value that Y would take if we intervened on X and set it (possibly counter to fact) to the value x.

- Let Y (x) be the value that Y would take if we intervened on X and set it (possibly counter to fact) to the value x.
- Let *Y*(*x*, *m*) be the value that *Y* would take if we intervened simultaneously on both *X* and *M* and set them to the values *x* and *m*.

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のので

- Let Y (x) be the value that Y would take if we intervened on X and set it (possibly counter to fact) to the value x.
- Let *Y*(*x*, *m*) be the value that *Y* would take if we intervened simultaneously on both *X* and *M* and set them to the values *x* and *m*.
- Let *M*(*x*) be the value that *M* would take if we intervened on *X* and set it to *x*.

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のので

- Let Y (x) be the value that Y would take if we intervened on X and set it (possibly counter to fact) to the value x.
- Let *Y*(*x*, *m*) be the value that *Y* would take if we intervened simultaneously on both *X* and *M* and set them to the values *x* and *m*.
- Let *M*(*x*) be the value that *M* would take if we intervened on *X* and set it to *x*.
- Let Y {x, M(x\*)} be the value that Y would take if we intervened on X and set it to x whilst simultaneously intervening on M and setting it to M(x\*), the value that M would take under an intervention setting X to x\*, where x and x\* are not necessarily equal.

- Let Y (x) be the value that Y would take if we intervened on X and set it (possibly counter to fact) to the value x.
- Let *Y*(*x*, *m*) be the value that *Y* would take if we intervened simultaneously on both *X* and *M* and set them to the values *x* and *m*.
- Let *M*(*x*) be the value that *M* would take if we intervened on *X* and set it to *x*.
- Let *Y* {*x*, *M*(*x*\*)} be the value that *Y* would take if we intervened on *X* and set it to *x* whilst simultaneously intervening on *M* and setting it to *M*(*x*\*), the value that *M* would take under an intervention setting *X* to *x*\*, where *x* and *x*\* are not necessarily equal.

These counterfactuals are central to the (model-free) definitions of direct/indirect effects in causal inference.

• The total causal effect of *X* on *Y* expressed as a mean difference is

 $\mathsf{TCE} = E\{Y(1)\} - E\{Y(0)\}.$ 

• The total causal effect of *X* on *Y* expressed as a mean difference is

 $TCE = E \{ Y(1) \} - E \{ Y(0) \}.$ 

• Note that this can also be written as

 $\mathsf{TCE} = E[Y\{1, M(1)\}] - E[Y\{0, M(0)\}].$ 

 $CDE(m) = E \{Y(1,m)\} - E \{Y(0,m)\}.$ 

▲ロト ▲御 ト ▲ 臣 ト ▲ 臣 ト の Q ()

 $CDE(m) = E \{Y(1,m)\} - E \{Y(0,m)\}.$ 

• This (as always with a causal contrast) is a comparison of two hypothetical worlds.

 $CDE(m) = E \{Y(1,m)\} - E \{Y(0,m)\}.$ 

- This (as always with a causal contrast) is a comparison of two hypothetical worlds.
- In the first, X is set to 1, and in the second X is set to 0. In both worlds, *M* is set to *m*.

・ロト ・ 一 ・ ・ 日 ・ ・ 日 ・ ・ 日 ・

 $CDE(m) = E\{Y(1,m)\} - E\{Y(0,m)\}.$ 

- This (as always with a causal contrast) is a comparison of two hypothetical worlds.
- In the first, *X* is set to 1, and in the second *X* is set to 0. In both worlds, *M* is set to *m*.
- By keeping *M* fixed at *m*, we are getting at the direct effect of *X*, unmediated by *M*.

・ コット ( 雪 ) ・ ( 目 ) ・ ヨ )

• Ideally, we would express the total causal effect as the sum of a direct and an indirect effect.

▲ロト ▲御 ト ▲ 臣 ト ▲ 臣 ト ● 回 ● の Q @

- Ideally, we would express the total causal effect as the sum of a direct and an indirect effect.
- But this turns out not to be possible using this definition of a controlled direct effect.

- Ideally, we would express the total causal effect as the sum of a direct and an indirect effect.
- But this turns out not to be possible using this definition of a controlled direct effect.
- For this reason, it is useful to have a different definition of a direct effect.

 $\mathsf{NDE} = E[Y\{1, M(0)\}] - E[Y\{0, M(0)\}].$ 

◆□▶ ◆□▶ ◆□▶ ◆□▶ ◆□ ◆ ◇◇◇

De Stavola & Daniel/Mediation

 $\mathsf{NDE} = E[Y\{1, M(0)\}] - E[Y\{0, M(0)\}].$ 

• This is a comparison of two hypothetical worlds.

-

・ロト ・ 雪 ト ・ ヨ ト ・

 $\mathsf{NDE} = E[Y\{1, M(0)\}] - E[Y\{0, M(0)\}].$ 

- This is a comparison of two hypothetical worlds.
- In the first, X is set to 1, and in the second X is set to 0. In both worlds, M is set to M(0), the value it would take if X were set to 0.

-

< ロ > < 同 > < 回 > < 回 > <

 $\mathsf{NDE} = E[Y\{1, M(0)\}] - E[Y\{0, M(0)\}].$ 

- This is a comparison of two hypothetical worlds.
- In the first, X is set to 1, and in the second X is set to 0. In both worlds, M is set to M(0), the value it would take if X were set to 0.
- Since *M* is the same (*within* subject) in both worlds, we are still getting at the direct effect of *X*.

< 日 > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

- This is the g-computation formula.
- It requires correct specification of these parametric associational models for Y | C, X, L, M and L | C, X.

 $CDE(m) = E \{Y(1,m)\} - E \{Y(0,m)\}$ =  $\int E(Y|C = c, X = 1, L = l, M = m) f_{L|C,X}(l|c, 1) f_C(c) dl dc$ -  $\int E(Y|C = c, X = 0, L = l, M = m) f_{L|C,X}(l|c, 0) f_C(c) dl dc$ 

- This is the g-computation formula.
- It requires correct specification of these parametric associational models for *Y* |*C*, *X*, *L*, *M* and *L* |*C*, *X*.
- Both models can be completely flexible: they can include non-linearities and interactions.

(日)

 $CDE(m) = E \{Y(1,m)\} - E \{Y(0,m)\}$ =  $\int E(Y|C = c, X = 1, L = I, M = m) f_{L|C,X}(I|c, 1) f_C(c) dI dc$ -  $\int E(Y|C = c, X = 0, L = I, M = m) f_{L|C,X}(I|c, 0) f_C(c) dI dc$ 

- This is the g-computation formula.
- It requires correct specification of these parametric associational models for *Y* |*C*, *X*, *L*, *M* and *L* |*C*, *X*.
- Both models can be completely flexible: they can include non-linearities and interactions.
- By marginalising over *L* |*C*, *X*, intermediate confounding is appropriately dealt with.

 In the absence of intermediate confounding, non-linearities and interactions, this becomes α<sub>1</sub> as earlier.

- In the absence of intermediate confounding, non-linearities and interactions, this becomes *α*<sub>1</sub> as earlier.
- The g-computation formula thus generalises the earlier approaches to allow felxible modelling, interactions and intermediate confounding.

- In the absence of intermediate confounding, non-linearities and interactions, this becomes *α*<sub>1</sub> as earlier.
- The g-computation formula thus generalises the earlier approaches to allow felxible modelling, interactions and intermediate confounding.
- The associational models can be estimated using usual regression-fitting techniques (OLS, ML).

- In the absence of intermediate confounding, non-linearities and interactions, this becomes *α*<sub>1</sub> as earlier.
- The g-computation formula thus generalises the earlier approaches to allow felxible modelling, interactions and intermediate confounding.
- The associational models can be estimated using usual regression-fitting techniques (OLS, ML).
- If analytically intractable, the integration over *L* can be done by Monte Carlo simulation.

- In the absence of intermediate confounding, non-linearities and interactions, this becomes *α*<sub>1</sub> as earlier.
- The g-computation formula thus generalises the earlier approaches to allow felxible modelling, interactions and intermediate confounding.
- The associational models can be estimated using usual regression-fitting techniques (OLS, ML).
- If analytically intractable, the integration over *L* can be done by Monte Carlo simulation.
- SEs can be obtained either by the delta method or by bootstrapping.

### Multiple mediators

• Often there are many mediators of interest, eg many metabolites potentially mediating the relationship between CVD SNPs and CVD.

3

### Multiple mediators

- Often there are many mediators of interest, eg many metabolites potentially mediating the relationship between CVD SNPs and CVD.
- Unless these do not causally affect one another (unlikely), and if we are interested in path-specific effects, this makes things much more complicated (Daniel et al, under review).

・ ロ マ チ 全 早 マ キ 雪 マ ト ・ 日 マ

• Interest may lie not in mediation *per se* but in interactions between *X* and *M*, eg SNP and DNA methylation.

(a)

- Interest may lie not in mediation *per se* but in interactions between *X* and *M*, eg SNP and DNA methylation.
- Standard approaches (regression of *Y* on *X*, *M*, *X* \* *M* and confounders) are then essentially attempting to estimate the CDE at each *m* and assess whether these CDEs are all the same.

< ロ > < 同 > < 回 > < 回 >

- Interest may lie not in mediation *per se* but in interactions between *X* and *M*, eg SNP and DNA methylation.
- Standard approaches (regression of *Y* on *X*, *M*, *X* \* *M* and confounders) are then essentially attempting to estimate the CDE at each *m* and assess whether these CDEs are all the same.
- But if there are unmeasured confounding of *M* and *Y*, for example, this would lead to bias in these estimates and, potentially, to misleading conclusions about the presence and magnitude of any interaction.
