ECONOMICS AND CHOICE

Economics and choice

Resources are scarce and choices must be made

These choices give us information about individual preferences

HOW DO WE OBSERVE CHOICES?

WATCHING YOU

HOW DO WE OBSERVE CHOICES?

Revealed Preferences:
“What did you do?”

Stated Preferences:
“What would you do?”

HOW DO WE OBSERVE CHOICES?

Revealed Preferences:
“What did you do?”

Pros:

Face validity – people actually make the choice
Simple to analyse

Cons:

Choices must exist in reality (new products?)
Hard to get data on alternatives not chosen

WATCHING YOU

HOW DO WE OBSERVE CHOICES?

Revealed Preferences:
“What did you do?”

Stated Preferences:
“What would you do?”

HOW DO WE OBSERVE CHOICES?

WATCHING YOU

Pros:

Flexible – can focus on important tradeoffs
Not limited to existing alternatives

Cons:

Lower external validity – Hypothetical bias?

Stated Preferences:

“What would you do?”

Lancaster's theory of demand

“The whole is greater than the sum of its parts”

Aristotle, ~300 BC

Lancaster's theory of demand

exactly

"The whole is ~~greater than~~ the sum of its parts"

Kelvin Lancaster, 1966

Aristotle, ~300 BC

Lancaster's theory of demand

exactly

“The whole is ~~greater than~~ the sum of its parts”

Kelvin Lancaster, 1966

“The total utility gained from a product or service is the sum of the individual utilities provided by the attributes of that good”

Aristotle, ~300 BC

Discrete Choice Experiments

Discrete Choice Experiments: Brexit

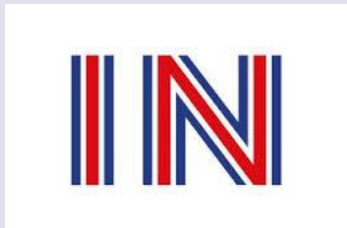

Discrete Choice Experiments: Brexit

Choice		
Economic impact	GDP increases by 1% per year	GDP increases by 0.5% per year

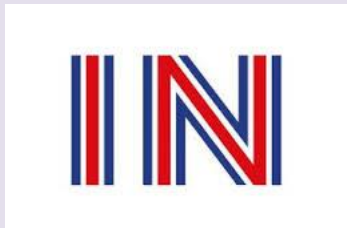

Discrete Choice Experiments: Brexit

Choice		
Economic impact	GDP increases by 1% per year	GDP increases by 0.5% per year
Net Migration	200,000 per year	150,000 per year

Discrete Choice Experiments: Brexit

Choice		
Economic impact	GDP increases by 1% per year	GDP increases by 0.5% per year
Net Migration	200,000 per year	150,000 per year
Prime Minister		

Discrete Choice Experiments: Brexit

Choice		
Economic impact	GDP increases by 1% per year	GDP increases by 1% per year
Net Migration	300,000 per year	150,000 per year
Prime Minister		

Discrete Choice Experiments: New HIV Prevention Products

Here are the products and this is what they do. Please select the product you would most prefer.

3	A
Product	<p>Injection</p> 
HIV Protection	<p>95% risk reduction</p>  <p>19 of 20 people remain HIV negative</p>
Pregnancy Protection	<p>Prevents pregnancy</p> 

B
<p>Oral PrEP</p> 
<p>75% risk reduction</p>  <p>15 of 20 people remain HIV negative</p>
<p>Prevents pregnancy</p> 

C
<p>Diaphragm and Microbicide Gel</p> 
<p>95% risk reduction</p>  <p>19 of 20 people remain HIV negative</p>
<p>Does not prevent pregnancy</p> 

Condom
<p>Condom</p> 
<p>95% risk reduction</p>  <p>19 of 20 people remain HIV negative</p>
<p>Prevents pregnancy</p> 

Discrete Choice Experiments: Essay Cheating

	Buy Essay 1	Buy Essay 2	Buy Essay 3	Buy None of Them
Price of Essay	£100	£75	£100	
Risk of Being Caught	1 in 100	1 in 100	1 in 1000	
Penalty if Caught	Repeat the Year	0% for the Unit	Repeat the Year	
Quality of the Essay	1 st Class	2(i)	3 rd Class	
What would you do? Tick one option (✓)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

 - “How many people will vote to leave?”

Demand forecasts (market share)

Results

- Attribute preferences
 - “What is the most important attribute of the Brexit choice?”
- Demand forecasts
 - “How many people will vote to leave?”
- Willingness to pay
 - “How much would GDP need to increase by for you to accept a migration increase of 100,000?”

Summary: Advantages of DCEs

- Provide policy relevant information
 - What is important to people?
 - How might people trade-off between attributes?
 - Simulation of possible scenarios

Summary: Advantages of DCEs

- Provide policy relevant information
 - What is important to people?
 - How might people trade-off between attributes?
 - Simulation of possible scenarios
- Basic results easy to interpret
 - Well received by policy makers
- Easy for participants to understand
 - Mimic real choice behaviour

Summary: Disadvantages of DCEs

- Hypothetical choices
 - Limited external validity?
- Simplified (simplistic?) approach to choices

Summary: Disadvantages of DCEs

- Hypothetical choices
 - Limited external validity?
- Simplified (simplistic?) approach to choices
- Complex to design and analyse
- Cognitively demanding surveys
 - Heuristics, fatigue, etc.

Methods for Eliciting Preferences

QUANTITATIVE TECHNIQUES		
<u>Ranking Techniques</u> <ul style="list-style-type: none">▪ Simple ranking▪ Qualitative discriminant process▪ Conjoint analysis	<u>Rating Techniques</u> <ul style="list-style-type: none">▪ Likert scale▪ Visual analogue scale▪ Guttman scales▪ Conjoint analysis▪ Semantic differential technique▪ Satisfaction surveys▪ SERVQUAL	<u>Choice-Based Techniques</u> <ul style="list-style-type: none">▪ Simple choice exercises▪ Discrete Choice Experiments▪ Analytic hierarchy process▪ Standard gamble▪ Time trade-off▪ Willingness to pay▪ Allocation of points

QUALITATIVE TECHNIQUES	
<u>Individual Approaches</u> <ul style="list-style-type: none">▪ One-to-one interviews▪ Dyadic interview▪ Case study analysis▪ Delphi technique▪ Complaints procedures	<u>Group Approaches</u> <ul style="list-style-type: none">▪ Focus groups▪ Concept mapping▪ Citizen juries▪ Consensus panels▪ Public meetings▪ Nominal group techniques

Ranking

RANK the Importance of the following FIVE factors in your choice of a laptop from 1 (Most Important) to 4 (Least Important):

	Rank
1. Power	
2. Weight	
3. Battery life	
4. Price	

Ranking of factors

Average Rank (95%CI)

Limitations of ranking

- No relative strength of preferences
- Unclear implementation of decision rule from results

Information obtained in a DCE

$$V = \alpha + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \dots + \beta_k X_k$$

Where

α : alternative-specific constant

X_j : attributes

β_j : parameters (relative importance of attributes)

Discrete Choice Model Estimation

Individuals maximise U_{ij} which is composed of an explainable systematic component V_{ij} and a random component ε_{ij} :

$$U_{ij} = V_{ij} + \varepsilon_{ij}$$

Where:

$$V_{ij} = \beta_1 X_{1j} + \beta_2 X_{2j} + \beta_3 Z_{3j} + \dots + \beta_k X_{kj} + \beta_k Z_{kj}$$

Where each β term represents the weight that individual n places on the corresponding design attributes X_{kj} . Z_{kj} represents individual socio-demographic characteristics.

According to random utility theory (RUT) we assume that individuals choose alternative such that they maximise utility.

Estimation – Multinomial logit

$$P_{ij} = \frac{\exp(X_j' \beta)}{\sum_{q=1}^J \exp(X_q' \beta)}$$

- Assumptions:
 - All errors independent and follow type-1 extreme distribution
 - Error terms and choice probabilities subject to iia restriction
 - Does not account for heterogeneity in preferences across individuals
- Computationally quick and easy to run, good to scope out model structure
- MNL (or nested logit) unlikely to be acceptable final model

Estimation – Random parameter logit (mixed logit)

The mixed logit model explicitly accounts for respondent heterogeneity in value judgements, allowing parameters to vary by respondent, i , such that:

$$\beta_{ki} = \bar{\beta}_k + \eta_{ki}$$

Where $\bar{\beta}_k$ is the population mean and η_{ki} the individual deviation representing heterogeneity in value judgements.

$$= \int \left(\frac{\exp(\mathbf{X}'_j \boldsymbol{\beta} + \mathbf{U}'_j \boldsymbol{\eta}_i)}{\sum_{q=1}^J \exp(\mathbf{X}'_q \boldsymbol{\beta} + \mathbf{U}'_q \boldsymbol{\eta}_i)} \right) f(\boldsymbol{\eta}_i | \boldsymbol{\theta}) d\boldsymbol{\eta}_i$$

- Introduces random parameters
 - Accounts for heterogeneity
 - Allows for correlation across error terms, negates requirement for iia assumption

Historical Development of DCEs

- Origins
 - Psychometrics (conjoint analysis)
 - Econometrics (choice modelling)
- Application
 - Market research
 - Transport economics
 - Environmental economics
 - Health economics (Late 1990s)

Applications of DCE in health

- Valuing patients' preferences
 - Patients' experience factors vs. health outcomes
 - WTP for QALY
- Patients' service preferences
- Pharmaceutical industry
- Service providers' treatment preferences
- Labour supply decisions

Steps in DCE studies

1. DCE design

ATTRIBUTE	LEVELS
1. Whether the practice is open at lunchtime (12-2pm)	<ul style="list-style-type: none"> ▪ Never ▪ Sometimes
2. Whether the practice has extended opening hours	<ul style="list-style-type: none"> ▪ Yes ▪ No
3. How quickly you can normally be seen by a GP in this practice	<ul style="list-style-type: none"> ▪ Same day ▪ Next day ▪ A few days later ▪ A week or more

2. Experimental design

set	r0	r1	r2	u0	u1	u2
1	1	1	2	2	2	1
2	1	1	3	2	1	1
3	1	2	4	2	1	1
4	1	2	3	2	2	1
5	1	2	4	2	2	1
6	1	1	4	2	2	1
7	1	1	3	2	2	1
8	1	1	4	2	1	1

3. Survey

Choice 1 out of 16

Choice 2 out of 16

	PRACTICE IN your local neighbourhood	PRACTICE OUTSIDE your local neighbourhood
Open on Saturday and Sunday morning (8am-12pm)	Not open on Saturday or Sunday morning	Not open on Saturday or Sunday morning
Open at lunchtime (12-2pm)	Open at lunchtime	Not open at lunchtime
Extended opening hours (either 7-8am or 6-8pm)	Extended opening hours	No extended opening hours
How quickly can usually be seen by a GP	Next day appointment	Same day appointment
Meets your specific health needs	Does not meet your specific needs	Meets your specific needs
Experience of other health care services in your local neighbourhood	Has previous experience with your local health services	Does not have previous experience with your local services

Which choose

Which of these two practices would you choose to register with?

5. Analysis

4. Data

Q1	Q2	Q3	Q4	Q5
0	1	0	1	0
1	1	1	0	1
0	0	0	0	1
1	1	0	0	0
0	0	0	0	1
